developed on the basis of nitrated oil; this composition
surpasses in efficiency analogous protective lubricants
and is prospective from standpoint of production

Commercial butylene fraction was pyrolyzed in the presence of oxygen at 1200 C under 60-120 mm Hg and at a gas residence time of 0.001 sec. in mixture with hydrogen. The process was investigated by the dynamic method, varying the oxygen content up to 38 vol. %. It was found that 8 to 10 vol. % oxygen sharply reduces the coke and resin yields in comparison to the thermal (Chemistry--Physical, TT, v. 10, no. 11) (over)

A continuous process was used with a direct-flow
scheme, connecting in series four oxidation columns
with continuous feed of the raw material by pump into
the first column and release of the final oxidation
product from the fourth column. This arrangement
raised sharply the productivity of the apparatus and
made it possible to obtain a final product of constant
quality. (Author)
